4-year-old male with stridor

John J. DeBevits IV, MD
Laryngotracheobronchitis (Croup)
Severe subglottic tracheal narrowing, aka “steeple sign”

Subtle dilatation of the hypopharynx
Laryngotracheobronchitis (Croup)

- Most common cause of stridor in young children
  - Inspiratory and expiratory
- Inflammation of the glottis, subglottic trachea, trachea, and even bronchi
- Viral cause, typically Parainfluenza type I
- Plain film mostly to exclude aspiration of foreign body or retropharyngeal abscess
- Classic “steeple sign” on AP film
- May also see hypopharyngeal dilatation
- Treatment with nebulized epinephrine (racemic) and steroids
- Self-limited, rarely requiring hospitalization or intubation
