#### Left Superior Vena Cava

- Venous variant draining blood from left upper extremity and head
- Due to failure of left anterior cardinal vein regression
- 80-90% drain via coronary sinus into right atrium
  - Coronary sinus is usually dilated
- 10-20% drain into left atrium, therefore PICC line should not be placed into left SVC due to risk of stroke.
- 80-90% exist with right sided superior vena cava
- Usually asymptomatic
- Found incidentally on imaging or during venous line placement
