Colloid Cyst
Colloid Cyst

• Pathogenesis: developmental malformation derived from primitive neuroepithlium or endoderm
  – Two cell layers: an outer fibrous layer and an inner epithelium layer
• Most often occur in the roof of the third ventricle – blocking the foramen of Monro and therefore producing hydrocephalus
Colloid Cysts

- Most often present between the third and sixth decades
- Symptoms:
  - Often asymptomatic
  - Increased intracranial pressure
    - Headache, papilledema, gait abnormalities (rare)
    - Vertigo, nausea, vomiting, diplopia
- Treatment:
  - Ventriculoperitoneal shunt can be used to relieve the hydrocephalus if excision is not an option
  - Surgical resection is curative
