# 58-year-old male presenting for possible kidney donation

Owen Karsmarski, MS3

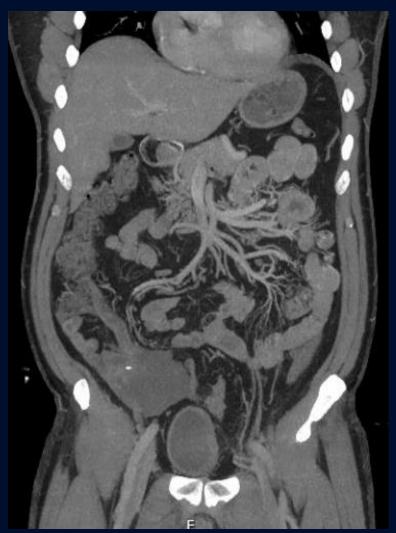

### CTA

# MIPS CTA

#### CT

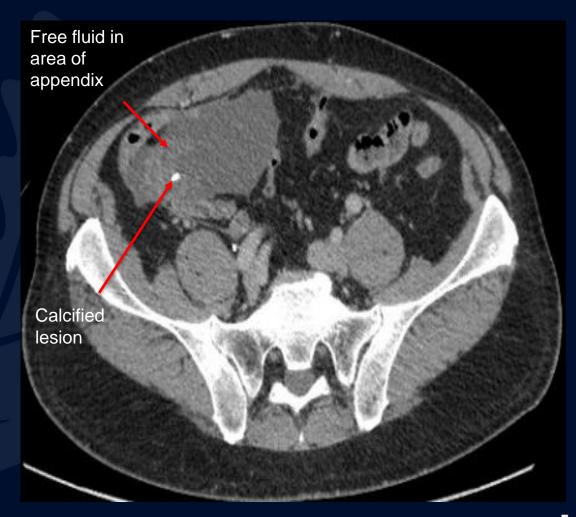

# Appendiceal Mucocele Neoplasm

#### CTA

## MIPS CTA

Normal ascending colon

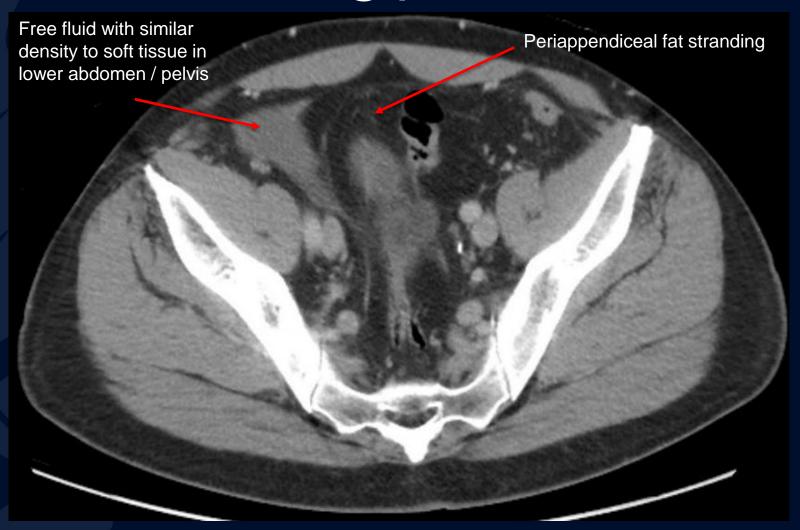

Dilated appendix off-cecum

#### CT

Abnormal fluid extending to level of bladder and pelvis with fat stranding

#### Appendiceal Mucocele Neoplasm

- Appendiceal mucoceles are a rare entity and can occur via nonneoplastic and neoplastic mechanisms
- Pathophysiology: Uncontrollable cell growth of epithelium of the appendix causing excessive mucous production causes dilation of the organ

#### Prognosis:

- Appendiceal mucocele neoplasms have varying prognosis based on extent of disease
- Failure of early diagnosis can lead to organ rupture and pseudomyxoma peritonei which has a poor prognosis
- Often picked up incidentally on x-ray showing soft tissue mass or CT scan but can also present with vague abdominal pain and palpable right lower quadrant mass

#### Imaging Findings

- CT Scan of Abdomen
  - Often will have low-attenuated, encapsulated round or tubular cystic mass in right lower quadrant extending off the cecum
  - Wall calcifications may or may not be present
  - Dilated appendix
  - Periappendiceal fat stranding, calcifications, and dilation > 2 cm highly suspicious for neoplasm
