Grey Matter Heterotopia

Interruption of the normal migration of neurons from the periventricular telencephalic germinal matrix to the cortex due to genetic abnormalities or infection/trauma

Divided macroscopically into

- Nodular heterotopias
 - Subependymal – most common
 - Subcortical
- Diffuse heterotopias
 - Band- also known as double cortex heterotopia and x-linked lissencephaly
 - Lissencephaly- types I and II
 - Laminar

Grey Matter Heterotopia

Clinical Presentation

- Most commonly present with focal seizures in the second decade of life
- +/- developmental delay or intellectual disability

Grey matter heterotopias are commonly associated with other congenital central nervous system anomalies including:

- Corpus callosum agenesis
- Schizencephaly
- Chiari II malformation
- Pachygryria, polymicrogyria
- Basilar cephaloceles

Imaging Findings

CT has limited use

- Difficult to appreciate small/focal involvement
- Slightly denser than surrounding white matter

MRI study of choice

- Heterotopic tissue follows same signal characters as grey matter on all sequences
- Also warrants careful examination to identify associated anomalies
- fMRI can demonstrate activation in heterotopic nodules, making epileptogenic EEG discharges
