Mesenteric Cyst

CT with IV contrast

Cystic lesion within the small bowel mesentery with fluid-fluid levels

CT with IV contrast

Mildly thickened wall
surrounding cystic
structure

Mesenteric Cyst

Mesenteric cyst is the term to describe any cystic mass in the mesentery

Histological classification includes

- Simple Mesothelial Cyst – mesothelium lined
- Chylolymphatic cyst or cystic lymphangioma – endothelium lined
- Enteric duplication cyst – epithelium lined
- Non-pancreatic pseudocyst – no cellular lining

Clinical Presentation

- Small mesenteric cysts may be asymptomatic and discovered as an incidental finding on imaging
- Larger mesenteric cysts present with nonspecific gastrointestinal symptoms such as abdominal pain, mass, or abdominal distention

Epidemiology

- The reported incidence of mesenteric cysts range from 1 in 100,000 to 250,000 hospital admissions

Imaging Findings

Ultrasound

- Well-defined, anechoic, spheroid structures
- Posterior acoustic enhancement
- No internal flow with doppler imaging

CT

- Well circumscribed, spheroid lesion
 - Homogenous near water attenuation → simple fluid
 - Lower than water attenuation and fluid-fluid levels → chylous or lipid contents

MRI

- Chylous components will appear hyperintense on T2 weighted imaging and lose signal intensity on T1 weighted imaging
